Akraino R3 includes XX blueprints (X new blueprints, and updates and improvements to X existing R3 blueprints) that support a variety of edge use cases across virtualized and container workloads, from connected vehicles to X, to Y to Z. These blueprints are tested and validated on real hardware supported by users and community members.

**[BLUEPRINT NAME]**

5G MEC/Slice System to Support Cloud Gaming, HD Video and Live Broadcasting

**[INSERT BLUEPRINT DIAGRAM, IF APPLICABLE]**

**[2-3 SENTENCE OVERVIEW OF BLUEPRINT]**
The 5G MEC BP consists of two network elements. One is the edge connector which is deployed in the cloud to enable traffic offloading, subscribe edge slice and implement application lifecycle management etc. The other is the edge gateway which is deployed close to the 4G/5G network to perform traffic steering, Local DNS service and traffic management etc.

**[3-5 BULLETS ON KEY FEATURES/IMPLEMENTATIONS OF BLUEPRINT]**

- Edge application agent (EAA) microservice for edge application registration.
- Local DNS (LDNS) microservice, which acts a DNS server.
- DNS CLI, configuring DNS policies enforced by the LDNS hosted on each Edge GW
- A 5GC emulator which provides traffic influence APIs to the edge connector and performs signaling and data exchange with the Edge GW during traffic offloading

**Upstream Updates Since Release 1**

- OpenNESS 20.03
- Docker 19.3.2
- kubernetes 1.17.0
- etcd 3.4.3-0
- Ansible 2.9.1
- kube-ovn 0.10.2
- openvswitch 2.11.4

[BACK]

Akraino Edge Stack is an open source project under the LF Edge umbrella that creates edge software stacks that supports high-availability cloud services optimized for edge computing systems and applications. It offers users new levels of flexibility to scale edge cloud services quickly, to maximize the applications and functions supported at the edge, and to help ensure the reliability of systems that must be up at all times. The Akraino Edge Stack platform integrates multiple open source projects to supply a holistic Edge Platform, Edge Application, and Developer APIs ecosystem.
Akraino uses the “blueprint” concept to address specific Edge use cases to support an end-to-end solution.

A blueprint is a declarative configuration of the entire stack-- i.e., edge platform that can support edge workloads and edge APIs.

To address specific use cases, a blueprint architecture is developed by the community and a declarative configuration is used to define all the components used within that architecture such as hardware, software, tools to manage the entire stack, and method of deployment (Blueprints are maintained using full CI/CD integration and testing by the community for ready download and install).

[SIDEBAR]

Akraino is part of the LF Edge umbrella organization that establishes an open, interoperable framework for edge computing independent of hardware, silicon, cloud, or operating system. By bringing together industry leaders, LF Edge creates a common framework for hardware and software standards and best practices critical to sustaining current and future generations of IoT and edge devices.

LF Edge Projects address the challenge of industry fragmentation, and collaborates with end users, vendors, and developers to transform all aspects of the edge and accelerate open source developments.
