

Akraino R6 includes IEC Type2 blueprints that support edge use cases which mainly focus on the SDN Enabled Broadband Access. These blueprints are tested and validated on real hardware supported by users and community members.

Akraino Blueprint: IEC Type 2

Overview

IEC (Integrated Edge Cloud) is a platform that enables new functionalities and business models on the network edge. It provides critical infrastructure to enable high performance, reduce latency, improve availability, lower operational overhead, provide scalability, address security needs, and improve fault management. The IEC targets telco applications and medium deployment of Edge Cloud. In this release, it is based on Kubernetes and Calico (and Flannel, Cilium) and installation is automated with installers and integrated with the SEBA use-case.

Insufficient memory and storage space for embedded devices is a resource-constrained environment and existing Kubernetes distributions are often memory intensive and overly complex for edge computing environments. The hardware condition is very harsh for embedded devices. Compared with IEC Type1, the low-power edge computing system, the IEC type 2 mainly focuses on the high-performance computing system of medium and/or large deployment at the data centre. At the same time, the IEC type 1, as an edge node, could be integrated with IEC Type 2 to be a whole edge computing system.

Key features in R6:

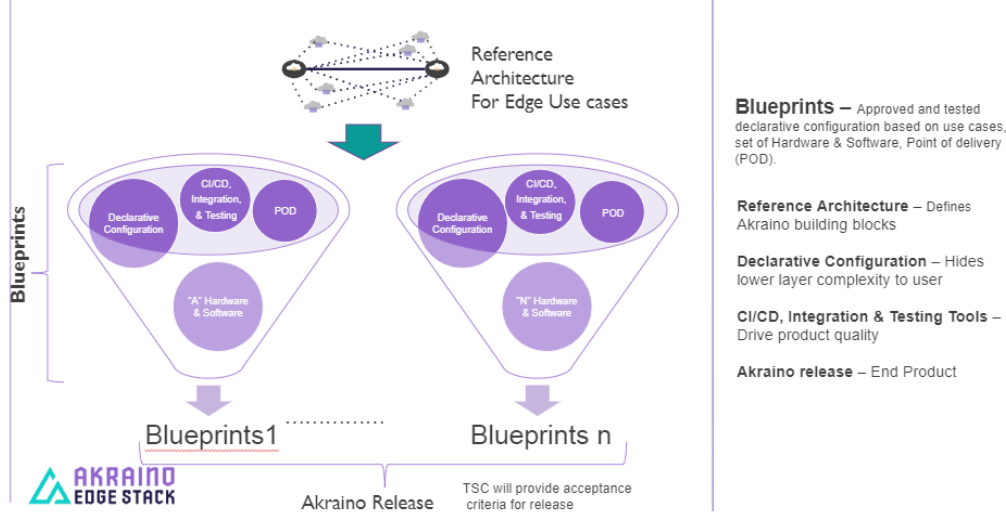

- Multiple CNIs (Calico, Flannel, Multus with SRIOV/Calico/Flannel) support
- Running environment deployment with multiple VMs
- Specific version (v1.22.0) of Kubernetes installation support for Ubuntu/Redhat
- Initial Restful API framework support
- Istio/bookinfo sample, microk8s integrated

[BACK]

Akraio Edge Stack is an open-source project under the LF Edge umbrella that aims to create edge software stacks that support high-availability cloud services optimized for edge computing systems and applications. It offers users new levels of flexibility to scale edge cloud services quickly, maximise the applications and functions supported at the edge, and help ensure the reliability of systems that must be up at all times. The Akraio Edge Stack platform integrates multiple open source projects to supply a holistic Edge Platform, Edge Application, and Developer APIs ecosystem.

Akraino Blueprints & release

- Akraino uses the “blueprint” concept to address specific Edge use cases to support an end-to-end solution.
- A blueprint is a declarative configuration of the entire stack-- i.e., an edge platform that can support edge workloads and edge APIs.
- To address specific use cases, a blueprint architecture is developed by the community and a declarative configuration is used to define all the components used within that architecture such as software, tools to manage the entire stack, and method of deployment (Blueprints are maintained using full CI/CD integration and testing by the community for ready download and install).

[SIDEBAR]

LF EDGE

Akraino is part of the LF Edge umbrella organization that establishes an open, interoperable framework for edge computing independent of hardware, silicon, cloud, or operating system. By bringing together industry leaders, LF Edge creates a common framework for hardware and software standards and best practices critical to sustaining current and future generations of IoT and edge devices.

LF Edge Projects address the challenge of industry fragmentation and collaborates with end-users, vendors, and developers to transform all aspects of the edge and accelerate open-source developments.
