

R1 API Documentation

Public APIs

Network Cloud blueprints deploy OpenStack environments to edge sites to address specific use cases. External applications are expected to use traditional [Openstack APIs](#) to interact with the edge sites after deployment including:

[Compute API](#)

[Identity API v3](#)

[Image service API v2](#)

[Networking API v2.0](#)

[Orchestration API v1](#)

All other APIs such as those used by the Regional Controller and Workflow engine are private and will be completely rewritten in future releases which makes them unsuitable for integration at this time.
