

SEBA for TA minutes 2019.11.4

Attendees

- Julie
- David
- Ciprian
- Tina
- Zack
- Tom

Agenda

- Validation lab status update
- Documentation status update
 - Final documentation review scheduled for 11/15/19
 - review self-certification slide deck and wiki updates
- how to coordinate between Akraino/ONF for upstreaming work for SEBA for TA on ARM - multi-architecture brigade (Tina)

Minutes

- Validation lab - no change, nightly builds occurring
- Documentation - David will work with Julie during 2nd half of this week
- What is status of SEBA on TA regarding issue with charts, APIs
 - Zack opened up a JIRA ticket in the SEBA JIRA system
 - for release 2, we will use the workaround implemented by David - not expecting to resolve issue immediately
- Request from Ciprian for David to send info on how to use regional controller to deploy (how to specify the application to load?)
 - Currently RIC and SEBA both require manual installation on top of REC; Jenkins job runs after REC build to install application via script
 - Next Monday, review Install. guide on call - identify follow-up questions at that time
- Tina: upstreaming - how to coordinate between Akraino community and ONF community, need to get upstream patches merged for SEBA on TA for ARM
 - Zack: Cachengo had a method of building images that worked; current issue is that ONF doesn't have experts to do ARM build
 - need to get AWS account set up, build AMI images for ARM, etc. (Tina indicated she can fund - she would be contact for account issues, Ciprian would be technical SME contact)
 - need ARM to set up on AWS account where start/stop work occurs (i.e, not on the account where long-term jobs run)
 - maybe share a billing account but a different role? separate account and invoice? separate account billed separately? (Zack will check at ONF on best way to handle account)
 - Ciprian: question on retrieving images for ARM that are not part of openCORD;
