Upgrading K8s components causes the Airship deployment to fail and the regional controller becomes incompatible. The development team was told to use a specific version of the regional controller and airship (as the older versions are stable and newer are in flux and fragile). When the team upgraded to the new version as per the security team's suggestion, everything else fell apart. Making this change will require several months of work as the development team has to upgrade a component at a time to bring everything to the latest version of code. We will address this in the next release.
